Gamma ROS Statistics using Imputed Non-Detects									
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs									
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)									
For such situations, GROS method may yield incorrect values of UCLs and BTVs									
This is especially true when the sample size is small.									
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use									
95% KM (t) UCL			0.854						
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.									
Recommendations are based upon data size, data distribution, and skewness using results from simulation studies.									
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.
